

ABSTRACT

To provide a block copolymer composition having a good balance in transparency and impact resistance, and particularly having an excellent impact resistance, by 5 making a molded product of injection molding under high shear condition in such a manner as to hardly generate anisotropy.

A block copolymer composed of a hard segment block comprising a block made mainly of a vinyl aromatic 10 hydrocarbon and a soft segment block comprising a block made mainly of a conjugated diene, characterized by having a remarkably improved impact resistance without degrading transparency in respect of not only an extrusion-molded product and a blow-molded product but 15 also an injection-molded product, by blending two kinds of block copolymers having a hard segment block of a specific structure.
